How to proxy NetIQ iManager with Apache ajp

iManager is a web based LDAP administration tool that has NetIQ specific tools as well as standard LDAP tools.

Motivation

iManager comes with an Apache *modjk config file* but *modjk* support is missing from CentOS 7 and RHEL 7 so we must use ajp proxying instead.

Apache configuration

Here is an example working Apache configuration `/etc/httpd/conf.d/iManager.conf`:

```
ProxyPass /nps ajp://localhost:9009/nps
ProxyPassReverse /nps ajp://localhost:9009/nps

<Location "/nps">
    Options +FollowSymLinks
</Location>

<Location "/nps">
    Options MultiViews FollowSymLinks
    Order allow,deny
    Allow from all
</Location>

<Location "/nps/WEB-INF/">
    deny from all
</Location>

<Location "/nps/META-INF/">
    deny from all
</Location>
```
