# Make Windows 10 bootable USB media in Linux

The simplest way I could find to make a bootable USB Windows installation media from ISO file goes as follows:

- plug in USB drive
- check the drive device from journalctl
- launch fdisk /dev/sdN
  - create a single partition of type type 7
  - mark partition as bootable
- mkfs.ntfs -f /dev/sdN1
- ms-sys -7 /dev/sdN1
- mount -o loop <windows-10-image-iso> /mnt/loop
- mount /dev/sdN1 /mnt/usb
- cp -a /mnt/loop/\* /mnt/usb/
- umount /mnt/usb /mnt/loop
- remove usb and try

That's it.
